In pregnancy, infections are a key cause of anemia and can be prevented by sleeping under a bednet and taking intermittent preventive treatment (IPTp) for malaria and deworming pills.

In pregnancy, anemia can be prevented by taking iron folic acid (IFA) supplements.

In 2011-2012, 43% of pregnant women in Congo consumed 90 or more IFA tablets.

Not enough women are taking IPTp to prevent malaria during pregnancy (22%, 2011-2012).

21% of infants in Congo are exclusively breastfed during the first six months after birth (2011-2012).

In 2011-2012, 65% of children 6-23 months of age consumed foods rich in iron.*

More than one-third (35%) of married adolescent girls expressed an unmet need for family planning (2011-2012).

*Includes meat (including organ meat and insects), fish, poultry, and eggs

A multisectoral approach to prevent anemia will save lives and improve the wellbeing of mothers, infants, and children.
Anemia has substantial negative effects on the health and economic wellbeing of nations and communities. Children with anemia experience irrevocable cognitive and developmental delays and exhibit decreased worker productivity as adults.\(^1\) Globally, maternal anemia increases the risk of pre-term delivery and low birth weight, and iron-deficiency anemia underlies 115,000 maternal deaths and 591,000 perinatal deaths each year.\(^2\)

### Trends in the prevalence of anemia in Congo

#### Children 6-59 months of age

<table>
<thead>
<tr>
<th>Year</th>
<th>Mild</th>
<th>Moderate</th>
<th>Severe</th>
</tr>
</thead>
<tbody>
<tr>
<td>2005</td>
<td>28.9</td>
<td>33.4</td>
<td>64.7%</td>
</tr>
<tr>
<td>2011-2012</td>
<td>32.3</td>
<td>33.5</td>
<td>66.7%</td>
</tr>
</tbody>
</table>

The DHS hemoglobin levels used to diagnose anemia in children 6-59 months in grams/dL are: Mild 10.0-10.9; Moderate 7.0-9.9; Severe <7.0; Any <12.0.

#### Women 15-49 years of age

<table>
<thead>
<tr>
<th>Year</th>
<th>Mild</th>
<th>Moderate</th>
<th>Severe</th>
</tr>
</thead>
<tbody>
<tr>
<td>2005</td>
<td>41.3</td>
<td>14.9</td>
<td>57.0%</td>
</tr>
<tr>
<td>2011-2012</td>
<td>42.6</td>
<td>11.3</td>
<td>54.2%</td>
</tr>
</tbody>
</table>

The DHS hemoglobin levels used to diagnose anemia in non-pregnant women 15-49 years of age in grams/dL are: Mild 10.0-11.9; Moderate 7.0-9.9; Severe <7.0; Any <12.0.

### Status of Policies or Strategies to Support Reductions in Anemia\(^*\)

- ✔️ IFA for pregnant women
- ✔️ IFA for women of reproductive age
- ✔️ IFA for adolescent girls
- ✔️ Iron and/or folic acid fortification legislation
- ✔️ Delayed cord clamping
- ✔️ Dietary diversity for complementary feeding
- ✔️ Micronutrient powders for children
- ✔️ Long-lasting insecticidal nets (LLINs) for household use
- ✔️ Indoor residual spraying
- ✔️ National policy on sanitation
- ✔️ IPTp for pregnant women
- ✔️ Malaria diagnosis and treatment
- ✔️ Deworming for children
- ✔️ Deworming for pregnant women
- ✔️ Breastfeeding
- ✗ no policy
- ✗ policy pending
- ✔️ policy in place
- □ missing documentation

---

\(^*\)Information from the Global database on the Implementation of Nutrition Action (GINA) (https://extranet.who.int/nutrition/gina/en) or country documentation. The status of policies and strategies have been identified to the best of our knowledge. Revisions and updates are welcome.

Evidence-informed WHO guidance can be found here: http://www.who.int/elena/en/
Anemia is a Preventable Condition—Simple Interventions Can Have a Huge Impact

Increase iron uptake and stores

IFA supplementation among pregnant women increased from 2005 to 2011-2012

Contraception use among married women did not change from 2005 to 2011-2012

Diverse food consumption among children 6-23 months in 2011-2012 varied across food groups

Reduce iron losses and infection

Long-lasting insecticidal net (LLIN) and insecticide treated mosquito net (ITN) use increased dramatically from 2005 to 2011-2012*

The percentage of children and women who received deworming medication in 2011-2012 was moderately high*

Exclusive breastfeeding of children <6 months increased slightly from 2005 to 2012

The percentage of households with an improved latrine/toilet increased but remains low*

All data is from Congo (Brazzaville) Demographic and Health Surveys unless otherwise noted

*Definition of ‘improved latrine/toilet’ has changed slightly across years. See Demographic and Health Surveys
Multiple Sectors Play a Role in Anemia Prevention and Treatment
Stunting and anemia share similar risk factors and are responsive to many of the same interventions

**Agriculture**
- Increase income and reduce poverty
- Production of biofortified and iron-rich crops
- Small livestock/poultry
- Dietary diversity

**Health**
- Iron supplementation
- Deworming
- Breastfeeding and complimentary feeding
- Family planning
- Malaria prevention and treatment
- Delayed cord clamping

**Water and Sanitation**
- Improved latrines
- Handwashing
- Access to clean water
- Livestock management
- Infectious disease prevention

**Education**
- Female literacy
- Health education
- Hygiene education
- Family planning education
- Nutrition education
